Abstract

Globally, disasters disrupt human lives and women tend to be more vulnerable during such events. This narrative review explores women’s experiences during disasters and identifies common factors increasing their vulnerability. After critical reading, 39 articles were included in this review. This paper underlines the themes in that literature to show that women across the world experience domestic violence, sexual assault, psychological and health problems as well as social and financial deprivation in disasters. The paper discusses the vulnerability of women particularly in Australia and New Zealand, through the lens of the global experience of women in disaster. This review highlights that, while there is consensus on the challenges faced by women in Australia, more research regarding interventions is required to reduce the negative effects of disasters on women. This review aims to inform emergency management practice in Australia and to direct further research to improve the outcomes for women and their safety.

Introduction

Gender equity and reducing inequality are 2 prominent priority Sustainable Development Goals to be achieved by 2030 (UNDP 2015). The Sendai Framework for Disaster Risk Reduction 2015–2030 acknowledges the importance of gender equity and the central role of women in preventive disaster management and building resilience (UNDRR 2017). These global frameworks underline international concern that women remain at a disadvantage in preparing for, surviving through and recovering from disasters. They are usually the most vulnerable group in a disaster context (WHO 2010), although the extent of women’s vulnerability and exposure to hazards may vary and depend on a range of social, economic and cultural factors, as well as their vulnerability, and the level of exposure experienced (Ginige, Amaratunga & Haigh 2014; Rezaeian 2013).

This paper summarises features of women’s vulnerability and experiences during and after disasters to improve the understanding of their vulnerability and depict the parallels between global and Australian/New Zealand vulnerability in disasters. An understanding of the vulnerability of women in the local region places Australian emergency management practice in context and suggests further research to improve women’s experiences and wellbeing in disasters.

Method

A narrative review is a non-systematic review that summarises the published literature on a specific topic or concept to reveal a new perspective based on existing knowledge, and to direct further research on the topic, thereby avoiding duplication of research (Ferrari 2015). The literature related to women’s experiences during and after disruptive events was searched using combinations of keywords of ‘women’, ‘disasters’/’disaster’, ‘emergencies’/‘emergency’, ‘gender’, ‘post-disaster’, ‘bushfire’. To identify a specific sub-set of the literature, the name of the countries ‘Australia’ and ‘New Zealand’ were used. Articles written
in English and published in or after 2007 were selected to provide relevance and validity of content. Additional articles were included after checking the reference lists of the identified papers. Searching continued until saturation was reached. After reviewing the titles of the identified papers, 74 papers including refereed papers and grey literature were obtained using electronic databases Scopus, ProQuest, Science Direct, Elsevier and Google Scholar. Articles were eliminated if there were inadequate referencing or lack of understanding due to language. In total, 39 articles were included after critical reading.

Results and discussion
The papers highlight how women’s disaster-associated experiences across the globe align with women’s challenges in Australia and New Zealand during and after disasters, irrespective of socio-economic class and cultural background. Despite evidence of women contributing to disaster preparation and response by building resilience in communities, the reported negative experiences by women generally outnumber the positive. The most notable among adverse outcomes were domestic violence, sexual assault and gender discrimination.

Domestic violence and intimate partner violence
Domestic violence and intimate partner violence are experienced by 30% of women worldwide under a wide range of circumstances (WHO 2017). However, during and after disasters, women experience higher rates of domestic violence and intimate partner violence. These occurrences are often overshadowed, and at times explained away, by other pressing matters associated with recovery and reconstruction after disasters.

Harville and co-authors (2011) investigated the extent of intimate partner violence after Hurricane Katrina in the Gulf Coast region of the United States using the Conflict Tactics Scale (a recognised instrument in domestic violence research used to quantify different forms of violence). The Conflict Tactics Scale was completed by 123 women affected by the hurricane and showed the level of violence they experienced. The findings were that nearly 5% of the respondents had been raped, sexually abused and/or battered on at least one occasion after the event. Excluding this 5%, the remaining respondents reported that they had been emotionally compromised and/or verbally abused, with 87% humiliated or insulted an 19% slapped, shoved and/or pushed repeatedly by their partners. Campbell and co-authors (2016) interviewed 208 women affected by the earthquake in Haiti, with 62% identifying as victims of physical assault and 80% of this sub-group being attacked by their partners and in some cases, their ex-partners. This highlighted the inability of women to reach out for help within their communities. This triggered mental health issues including depression, anxiety and post-traumatic stress disorder among the respondents.

Fisher (2010) and Pincha (2008a) provide evidence of increased levels of domestic violence and intimate partner violence in the temporary shelters in India and Sri Lanka after the 2004 tsunami. Fisher (2010) conducted 60 semi-structured interviews in tsunami-affected areas and documented incidents of beatings and murders of women by their husbands, often as a result of excessive alcohol or drug use and intoxication. The author also recorded brutal killings, including a husband burning his wife to death. Both Hines (2007) and Pincha (2008) worked on the tsunami disaster and its impacts on people in Tamil Nadu, India. They conducted qualitative research and a survey that confirmed the increased domestic violence towards women in the temporary shelters of these regions.

Gender-biased socio-cultural practices
Day-to-day, gender-biased, socio-cultural practices, household and community responsibilities and expectations of women may cause undesirable experiences for women during and after disaster. This has an impact on their rights, health and safety. Fagen and colleagues (2011) identified that, during the evacuation phase of Hurricane Katrina, women from New Orleans were not well-prepared for evacuation. Many did not get assistance from their partners and children were solely dependent on their mothers. This delayed the evacuation process for women. In some cases, the lack of willingness by male counterparts, and the taken-for-granted maternal culture, meant women took on full responsibility for their families and households in the post-hurricane stage. Men, living in the shelters during the recovery stage or in their houses after the recovery-rehabilitation stage, were reported by Thornton and Voight (2007) to have spent more money on personal entertainment than on household needs. As a result, many women had to take on responsibility for providing food for their families (Thornton & Voight 2007).

Nelson and co-authors (2002) argued that women from many cultures are expected to take sole responsibility for a range of activities including organising food and caring for children and sick family members. For example, during the recurrent floods in Manila in the Philippines, 68 female survey participants reported the expectation to take care of family during the flood emergencies, with 78% being responsible for providing food for family members and 56% looking after sick family members (Reyes & Lu 2016). In listing women’s priorities, Reyes and Lu...
either a lack of skilled birth attendants during childbirth or struck the Philippines, over 270,338 pregnant women suffered many pregnant women. In 2013, when super Typhoon Haiyan in emergencies. This triggered anxiety and depression among physiological condition and needed no additional consideration the care of pregnant women was not prioritised in the disaster Acharya (2017) found that after the 2015 Nepal earthquake, resulted in increased theft, begging, and prostitution following dependence on men put women into delayed rehabilitation and women's unemployment (Fulu 2007). Financial discrimination and their female workers, resulting in a 5% increase in the rate of the tsunami of 2011, worked voluntarily in the shelter kitchens. This review showed that, globally post-disaster, women face more unemployment and financial discrimination than men. Women staying in the evacuation centres in Tohoku, Japan after the tsunami of 2011, worked voluntarily in the shelter kitchens whereas male evacuees were offered paid jobs such as collecting debris (Saito 2012). After the 2004 tsunami in the Maldives, many employers recruited internally displaced men to replace the tsunami affected workers. Fulu (2007) found that the tsunami affected areas women were offered paid jobs whereas their male counterparts were offered unpaid community work. The literature on increased incidence of domestic violence increased by almost 50% over the ‘normal’ rate following the earthquakes to the New Zealand police for domestic violence incidents during the recovery stage were not interviewed who had experienced intimate partner violence following the fires. A total of 16 reported violence after the bushfire (14 experiencing it themselves and 2 reporting violence experienced by family members). Of these respondents, 9 were victimised for the first time in the relationship and the other 7 had previous experience of violence in their relationship, with the fires escalating the violence. After the 2010 series of earthquakes in the Canterbury region of New Zealand, domestic violence including child abuse and intimate partner violence rates increased in the affected areas (Campbell & Jones 2016). Callouts made during the weekend following the earthquakes to the New Zealand police for domestic violence increased by 50% over the ‘normal’ rate (Houghton et al. 2010). Even though the number of these incidents doubled, it was projected that almost 76% of total domestic violence incidents during the recovery stage were not reported to police (Campbell & Jones 2016). In addition, the incidence of domestic violence increased by almost 50% over the previous year (Ingber 2011). The literature on increased domestic violence and intimate partner violence following New regional and local contextual differences and variations.
Zealand earthquakes suggested that the filed complaints were regarded as sudden outbursts from male partners and therefore ignored. This indicates the barriers that women face in accessing assistance from support organisations (Campbell & Jones 2016). Most of the literature on women’s experiences, did not specify the underlying reasons behind domestic violence and intimate partner violence. The trends reported by the respondents suggested that violence was persistent from their partners and that frustrations from uncertainty and insecurity after the disaster was a catalyst for the violence. For example, almost 47% of the female participants in the Australian study who were assaulted for the first time in their relationship, acknowledged receiving disrespectful gestures from their partners multiple times beforehand and foreseeing the tendency for violence in their partners (Parkinson 2017). The culture of denial and deeply embedded male-dominated social structures gave men the opportunity to get away with such offences because, in many cases, these incidents were overlooked by law enforcement personnel, health workers, neighbours and even the victims themselves who rationalise spousal abuse as an understandable response to post-disaster trauma and frustration for men (Campbell et al. 2016, Fagen et al. 2011, Harville et al. 2011, Parkinson 2017).

Similar to women’s experiences in disasters across the globe, women in Australia and New Zealand experience discrimination and inequity in their households as a consequence of the patriarchal social structure (Parkinson & Zara 2011, Reynolds & Tyler 2018). Eriksen (2014) conducted a survey interview with 44 participants (26 women and 18 men) to identify the issues affecting women’s involvement in bushfire preparedness activities. Of the respondents, 78% strongly agreed or agreed that during a bushfire emergency, women are more likely to rely on male family members and peers for warning information, evacuation instructions and rescue activities. This can, at times, prevent them from taking action during emergencies.

Reynolds & Tyler (2018) argued that the preparedness and rescue practices of firefighters and volunteers have been highly masculinised and that evacuation was portrayed as ‘for the weak’ and considered as ‘feminine’ behaviour, which is one of the reasons for the disproportionately high percentage of male firefighters, officials and civil volunteers during bushfires. Although the Australasian Fire and Emergency Services Authorities Council (AFAC) has adopted a strategy to increase women’s representation in the fire management sector, the percentage of women’s overall representation is only 24% (AFAC 2019). This is still inadequate considering women comprise more than half the Australia’s total population (Australian Bureau of Statistics 2021).

Because of gender bias, women’s roles are often devalued within their households. Parkinson (2017) described women’s despair at not being taken seriously by their male partners during the Black Saturday bushfires. A similar argument was made by Tyler and Fairbrother (2018) finding that women’s knowledge of bushfire preparedness and response was often devalued and ignored in the male-dominated rural areas of Australia and that females in heterosexual relationships experience frustration and difficulty in convincing their partners to evacuate early.

Similar to the issues faced by various ethnic groups in the country, women of Aboriginal or Torres Strait Islander background have also faced challenges in getting involved in community resilience programs because the management approach of the Australian Government does not often recognise nor include Indigenous gender issues (Russel-Smith 2017).

Lessons for Australia

The selection of existing literature on women and disasters reviewed for this paper, both in a global context and in the Pacific region, highlights women’s vulnerability and exposure and the disproportionate effects of disasters on them. Even though a dialogue on the gendered nature of disaster events has been opened, and research has been undertaken on these issues over time (of which this paper reviews a selection), women’s voices have remained relatively unheard and are not effectively incorporated into national policies. This continues to have negative consequences for women’s wellbeing during disasters around the world.

Strategies should be revisited to minimise domestic violence, recognise it as a consequential outcome during the recovery phase and put in place suitable services. Women should be consulted frequently and included by organisations that have crucial roles during planning and preparedness activities. The particular needs of women, including financial support, employment and health needs should be identified and assimilated into existing response and recovery plans. Ethnic diversity and lifestyles should be acknowledged and incorporated in planning and policies to maximum the inclusion of women to develop practical and sustainable resilience plans.

In India, multi-purpose shelter task forces carry out search, rescue and first aid and have 50% participation of women, which strengthens their capacities and the capacity of the community.

Conclusion

The recurring issues faced by women in disasters highlight the significant need for their input into emergency management policies because people who have lived experiences can inform the decisions about important considerations in an inclusive manner. Future research should develop better understandings of women’s experiences, considering age, ethnicity, education and qualifications, marital status, levels of financial independence and other variables to distinguish patterns of women’s changing perceptions of their life situations in disasters. This can develop an improved understanding of women’s roles and potential in emergency and disaster preparedness and response activities, and in building the resilience of families and communities.

About the authors

Dr Tazrina Chowdhury is a research consultant at the Institute for Sustainable Futures, University of Technology Sydney. Her research focuses on women’s experiences in the cyclone shelters of Bangladesh and strengthening community resilience in coastal communities.

Professor Paul Arbon AM is a Matthew Flinders Distinguished Professor and Director of the Torrens Resilience Initiative and the World Health Organization Collaborating Centre for Mass Gatherings and Global Health Security at Flinders University.

Dr Mayumi Kako is a graduate from Kobe City College of Nursing in Japan. She has completed postgraduate study at Flinders University. She ran a program to improve women’s participation in disaster risk reduction in Japan.

Dr Robert Muller is a researcher and Adjunct Fellow at the Torrens Resilience Initiative. His research work is in globalisation, consumerism, resilience and mental health and the resilience of the deterrence effect. Robert’s current research interest is in information disorder.

Dr Malinda Steenkamp is Principal Policy Officer in the Security and Emergency Management Team, Department of Premier and Cabinet, South Australia. She has worked at the Torrens Resilience Initiative at Flinders University.

Professor Kristine Gebbie is in the Faculty of Health Sciences, Flinders University and is a Fellow of the Torrens Resilience Initiative. Her major interests are in disaster preparedness and response.
